# Networking Overview: "Everything" you need to know, in 50 minutes

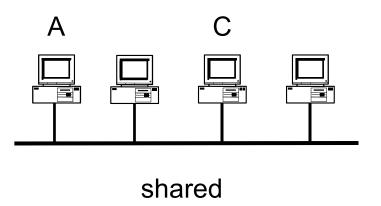

# Network Security Prof. Haojin Zhu

Adopted from David Wagner @ UC Berkeley

May 8, 2019

### **Local-Area Networks**

How does computer A send a message to computer C?

### **Local-Area Networks: Packets**

From: A

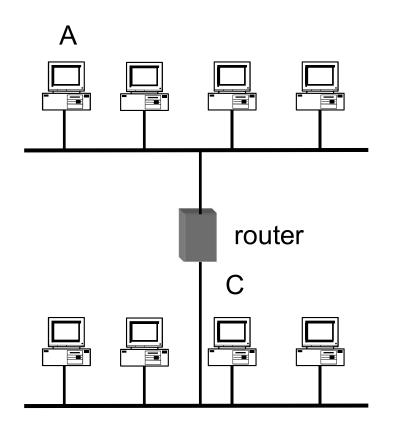

To: C

Message: Hello world!

A C Hello world!

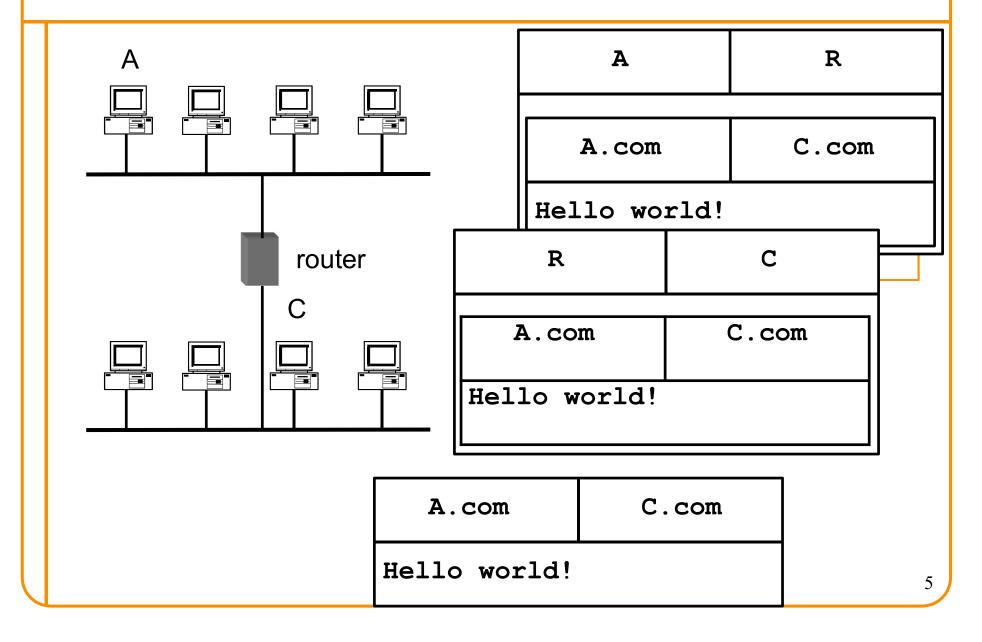

A C
Hello world!

### **Wide-Area Networks**

How do we connect two LANs?

### **Wide-Area Networks**

# **Key Concept #1:** *Protocols*

- A protocol is an agreement on how to communicate
- Includes syntax and semantics
  - How a communication is specified & structured o Format, order messages are sent and received
  - What a communication means
     o Actions taken when transmitting, receiving, or timer expires
- Example: making a comment in lecture?
  - 1. Raise your hand.
  - 2. Wait to be called on.
  - 3. Or: wait for speaker to pause and vocalize
  - 4. If unrecognized (after timeout): say "excuse me"

# **Key Concept #2: Dumb Network**

- Original Internet design: interior nodes ("routers") have no knowledge\* of ongoing connections going through them
- Not how you picture the telephone system works
  - Which internally tracks all of the active voice calls
- Instead: the postal system!
  - Each Internet message ("packet") self-contained

# Self-Contained IP Packet Format

#### IP = Internet *Protocol*

4-bit Version	4-bit Header Length	8-bit Type of Service (TOS)	16-bit Total Length (Bytes)				
16-bit Identification			3-bit Flags	13-bit Fragment Offset			
8-bit Time to Live (TTL)		8-bit Protocol	16-bit Header Checksum				
32-bit Source IP Address							
32-bit Destination IP Address							
Payload (remainder of message)							

Header is like a letter envelope: contains all info needed for delivery

# **Key Concept #2: Dumb Network**

- Original Internet design: interior nodes ("routers") have no knowledge\* of ongoing connections going through them
- Not: how you picture the telephone system works
  - Which internally tracks all of the active voice calls
- Instead: the postal system!
  - Each Internet message ("packet") self-contained
  - Interior routers look at destination address to forward
  - If you want smarts, build it "end-to-end", not "hop-by-hop"
  - Buys simplicity & robustness at the cost of shifting complexity into end systems

<sup>\*</sup> Today's Internet is full of hacks that violate this

# **Key Concept #3: Layering**

- Internet design is strongly partitioned into layers
  - Each layer relies on services provided by next layer below ...
  - and provides services to layer above it
- Analogy:
  - Consider structure of an application you've written and the "services" each layer relies on / provides

**Code You Write** 

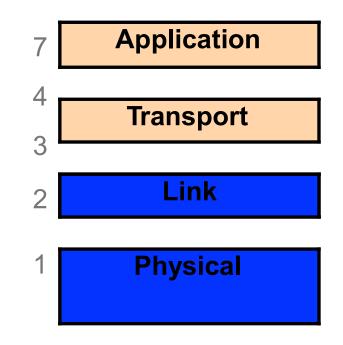

**Run-Time Library** 

**System Calls** 

**Device Drivers** 

Voltage Levels / Magnetic Domains

Fully isolated from user programs

Note on a point of potential confusion: these diagrams are always drawn with lower layers **below** higher layers ...

But diagrams showing the layouts of packets are often the *opposite*, with the lower layers at the **top** since their headers <u>precede</u> those for higher layers

# Horizontal View of a Single Packet

First bit transmitted

Link Layer Heade (Inter)Network Layer Header (IP) Transport Layer Header Application Data: structure depends on the application

# Vertical View of a Single Packet

First bit transmitted

**Link Layer Header** 

(Inter)Network Layer Header (IP)

**Transport Layer Header** 

Application Data: structure depends on the application

Application
 Transport
 Link
 Physical

# **Layer 1: Physical Layer**

Application
 Transport
 Encoding bits to send them over a single physical link
 e.g. patterns of voltage levels / photon intensities / RF modulation

# Layer 2: Link Layer

Application
Transport
Link
Physical

Framing and transmission of a collection of bits into individual messages sent across a single "subnetwork" (one physical technology)

Might involve multiple *physical links* (e.g., modern Ethernet)

Often technology supports broadcast transmission (every "node" connected to subnet receives)

# Layer 3: (Inter)Network Layer (IP)

Application
 Transport
 Link
 Physical

Bridges multiple "subnets" to provide *end-to-end* internet connectivity between nodes

Provides global addressing
 Works across different link
 technologies

**Different** for each Internet "hop"

# **Layer 4: Transport Layer**

Application
Transport
Link
Physical

End-to-end communication between processes

Different services provided:

TCP = <u>reliable</u> byte stream

UDP = unreliable datagrams

(<u>Datagram</u> = single packet message)

# **Layer 7: Application Layer**

7 Application
4 Transport
3 Link
1 Physical

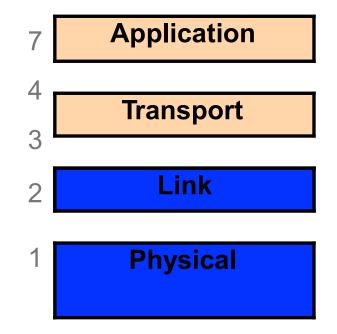

Communication of whatever you wish

Can use whatever transport(s) is convenient

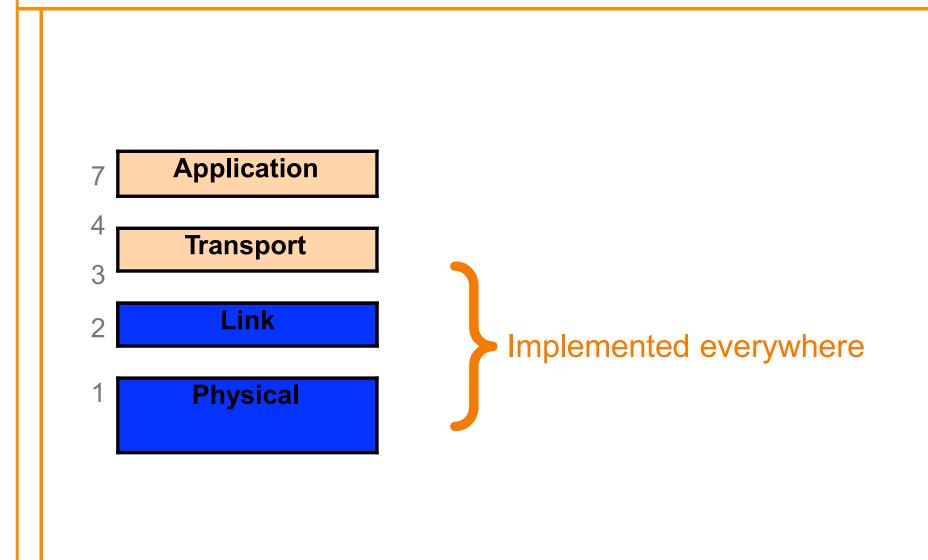

Freely structured

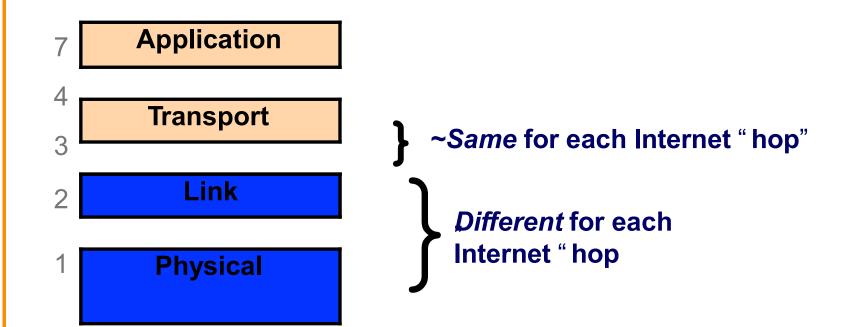

E.g.:

Skype, SMTP (email), HTTP (Web), Halo, BitTorrent

Implemented only at hosts, not at interior router ("dumb network")

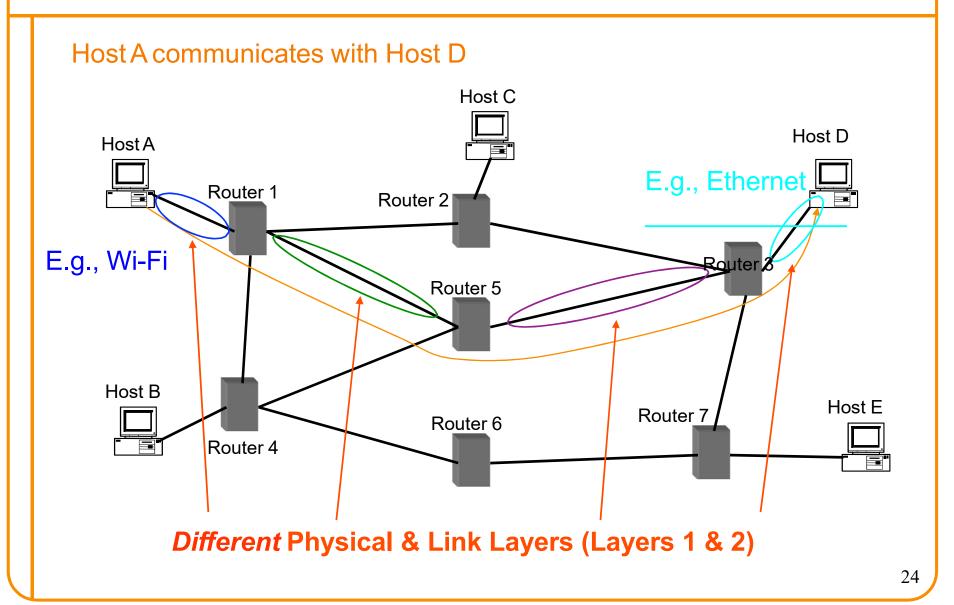

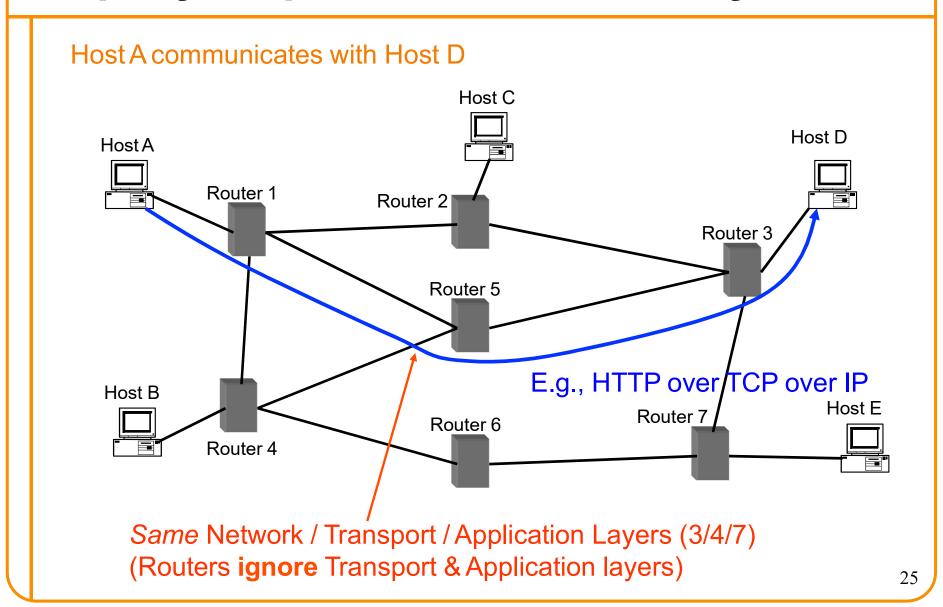

# Hop-By-Hop vs. End-to-End Layers

### Host A communicates with Host D Host C Host D Host A Router 1 Router 2 Router 3 Router 5 Host B Host E Router 7 Router 6 Router 4

# Hop-By-Hop vs. End-to-End Layers

# Hop-By-Hop vs. End-to-End Layers

# Layer 3: (Inter)Network Layer (IP)

Application
Transport
Link
Physical

Bridges multiple "subnets" to provide *end-to-end* internet connectivity between nodes

Provides global addressing

Works across different link technologies

4-bit 4-bit 8-bit
Version Header Type of Service 16-bit Total Length (Bytes)

4-bit Version	4-bit Header Length	8-bit Type of Service (TOS)	16-bit Total Length (Bytes)			
16-bit Identification			3-bit Flags	13-bit Fragment Offset		
8-bit Time to Live (TTL) 8-bit Protocol			16-bit Header Checksum			

32-bit Source IP Address

**32-bit Destination IP Address** 

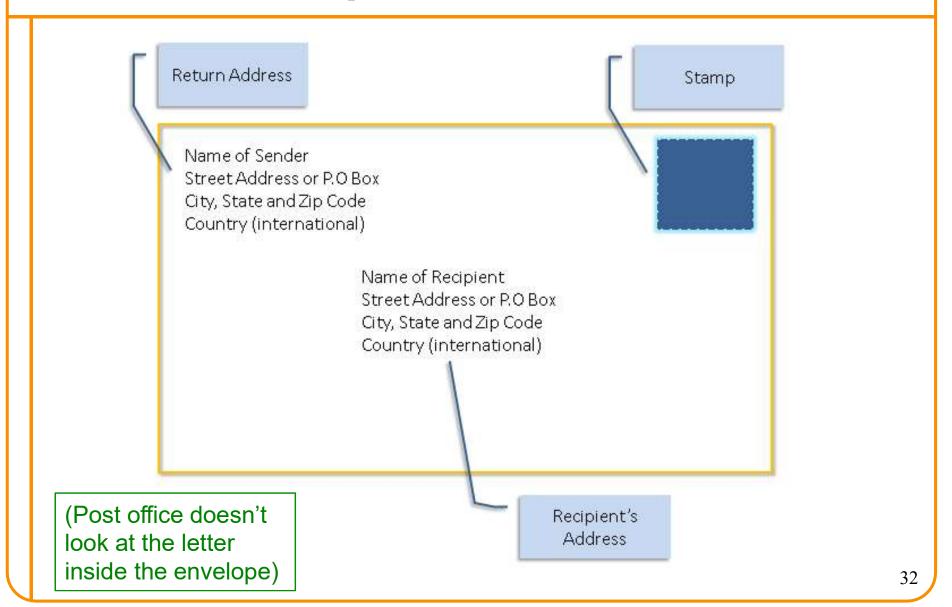

Options (if any)

Payload

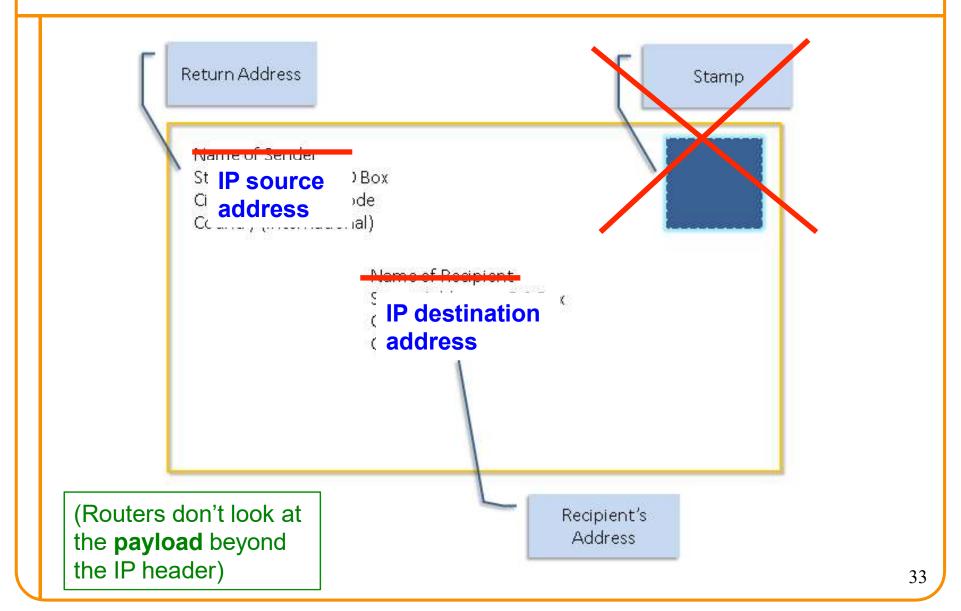

# IP Packet Header (Continued)

- Two IP addresses
  - -Source IP address (32 bits)
  - Destination IP address (32 bits)
- Destination address
  - Unique identifier/locator for the receiving host
  - -Allows each node to make forwarding decisions
- Source address
  - -Unique identifier/locator for the sending host
  - -Recipient can decide whether to accept packet
  - -Enables recipient to send a reply back to source,

# **Postal Envelopes:**

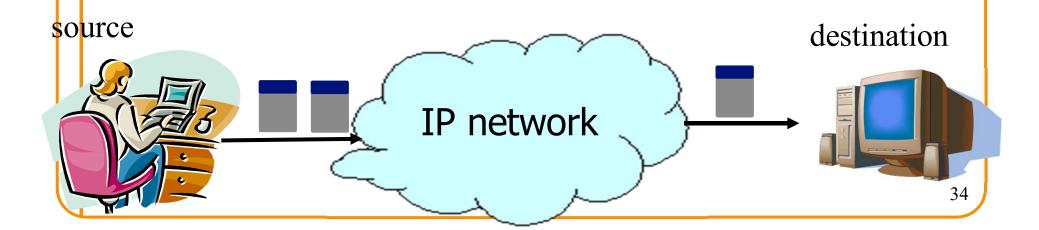

# **Analogy of IP to Postal Envelopes:**

# IP: "Best Effort" Packet Delivery

- Routers inspect destination address, locate "next hop" in forwarding table
  - Address = ~unique identifier/locator for the receiving host
- Only provides a "I'll give it a try" delivery service:
  - Packets may be lost
  - Packets may be corrupted
  - Packets may be delivered out of order

### "Best Effort" is Lame! What to do?

• It's the job of our Transport (layer 4) protocols to build services our apps need out of IP's modest layer-3 service

# **Layer 4: Transport Layer**

Application
Transport
Link
Physical

End-to-end communication between processes

Different services provided:

TCP = reliable byte stream

UDP = unreliable datagrams

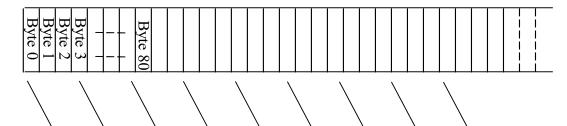

(<u>Datagram</u> = single packet message)

#### "Best Effort" is Lame! What to do?

- It's the job of our Transport (layer 4) protocols to build services our apps need out of IP's modest layer-3 service
- #1 workhorse: TCP (Transmission Control Protocol)
- Service provided by TCP:
  - Connection oriented (explicit set-up / tear-down)
    - o End hosts (processes) can have multiple concurrent long-lived communication
  - Reliable, in-order, byte-stream delivery
    - o Robust detection & retransmission of lost data

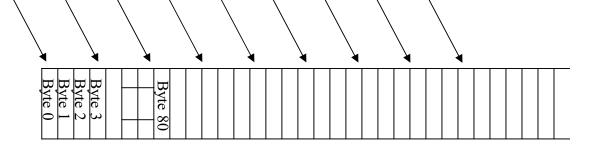

# TCP "Bytestream" Service

Process A on host H1

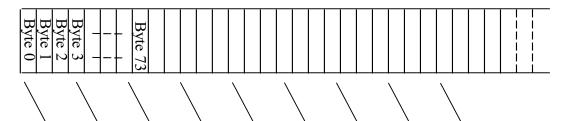

Hosts don't ever see packet boundaries, lost or corrupted packets, retransmissions, etc.

Process B on host H2

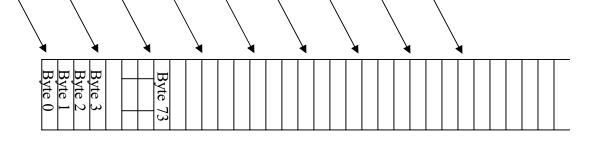

#### **Bidirectional communication:**

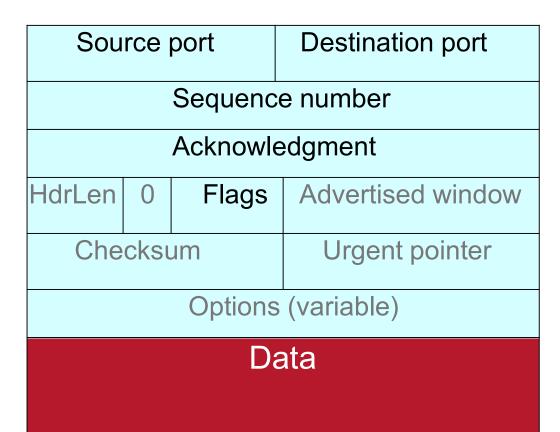

Process B on host H2

There are two separate **bytestreams**, one in each direction

Process A on host H1

Ports are **Destination port** Source port associated with OS Sequence number processes Acknowledgment HdrLen Advertised window Flags Checksum Urgent pointer Options (variable) Data

#### (Link Layer Header)

(IP Header)

Ports are associated with OS processes

IP source & destination addresses plus TCP source and destination ports uniquely identifies a TCP connection

Source port Destination port

Sequence number

Acknowledgment

HdrLen 0 Flags Advertised window

Checksum Urgent pointer

Options (variable)

Data

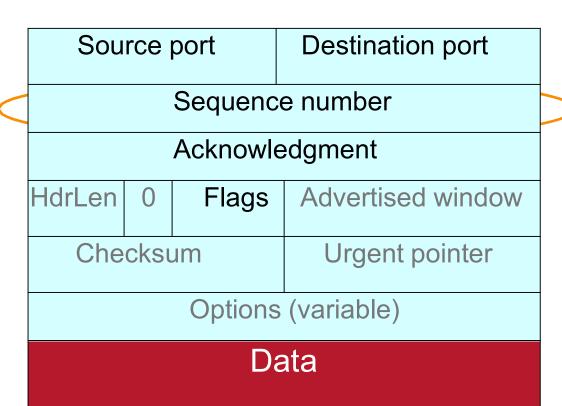

Ports are associated with OS processes

IP source & destination addresses plus TCP source and destination ports uniquely identifies a TCP connection

Some port numbers are "well known" / reserved e.g. port 80 = HTTP

Source port			Destination port				
Sequence number							
Acknowledgment							
HdrLen	0	Flags	Advertised window				
Checksum			Urgent pointer				
Options (variable)							
Data							

Starting sequence number (byte offset) of data carried in this packet

Starting sequence number (byte offset) of data carried in this packet

Byte streams numbered independently in each direction

Source port			Destination port			
Sequence number						
Acknowledgment						
HdrLen	0	Flags	Advertised window			
Checksum			Urgent pointer			
Options (variable)						
Data						

Starting sequence number (byte offset) of data carried in this packet

Byte stream numbered independently in each direction Source port Destination port

Sequence number

Acknowledgment

HdrLen 0 Flags Advertised window

Checksum Urgent pointer

Options (variable)

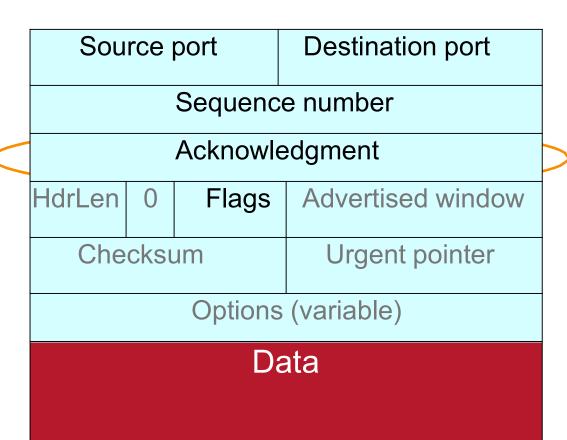

Data

Sequence number assigned to start of byte stream is picked when connection begins; **doesn't** start at 0

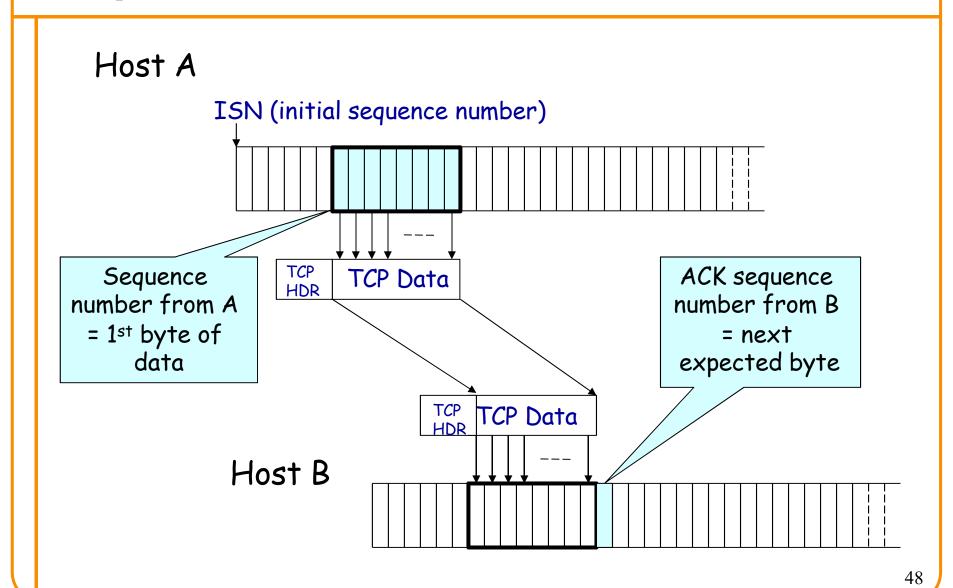

Acknowledgmen t gives seq # just beyond highest seq. received in order.

If sender sends

N bytestream
bytes starting at
seq S then
"ack" for it will
be S+N.

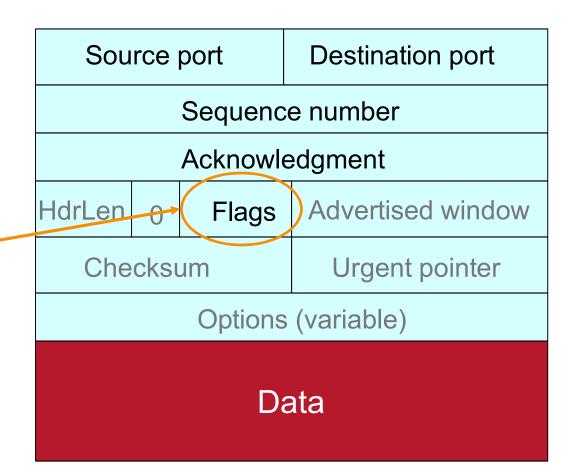

# **Sequence Numbers**

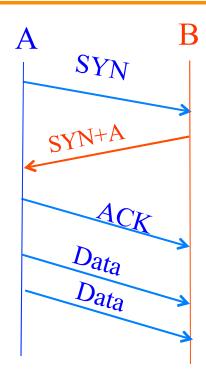

Uses include:

acknowledgin g data ("ACK")

setting up
("SYN") and
closing
connections
("FIN" and
"RST")

## **Establishing a TCP Connection**

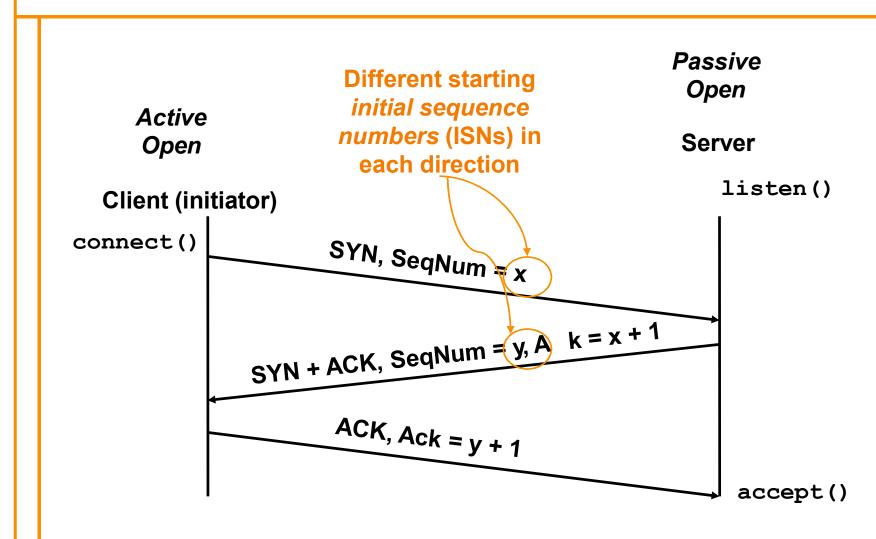

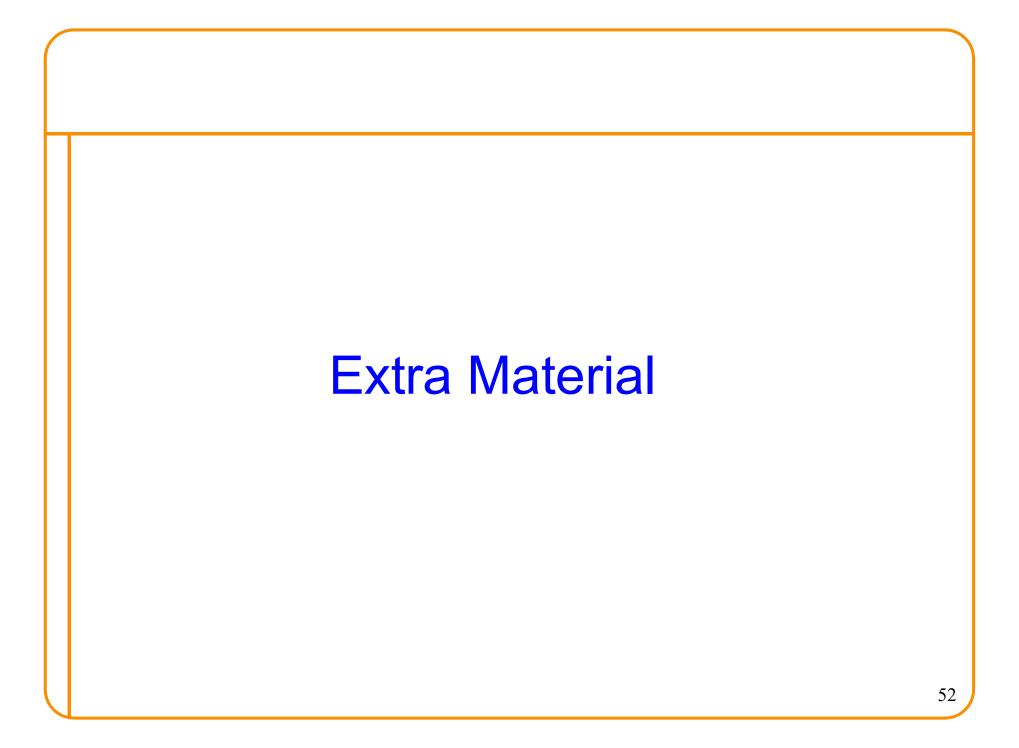

Each host tells its *Initial*Sequence Number
(ISN) to the other host.

(Spec says to pick based on local clock)

- Three-way handshake to establish connection
  - Host A sends a SYN (open; "synchronize sequence numbers") to host B
  - Host B returns a SYN acknowledgment (SYN+ACK)
  - Host A sends an ACK to acknowledge the SYN+ACK

# Timing Diagram: 3-Way Handshaking

## **Layer 7: Application Layer**

Application
Transport
Link
Physical

Communication of whatever you wish

Can use whatever transport(s) is convenient

Freely structured

E.g.:

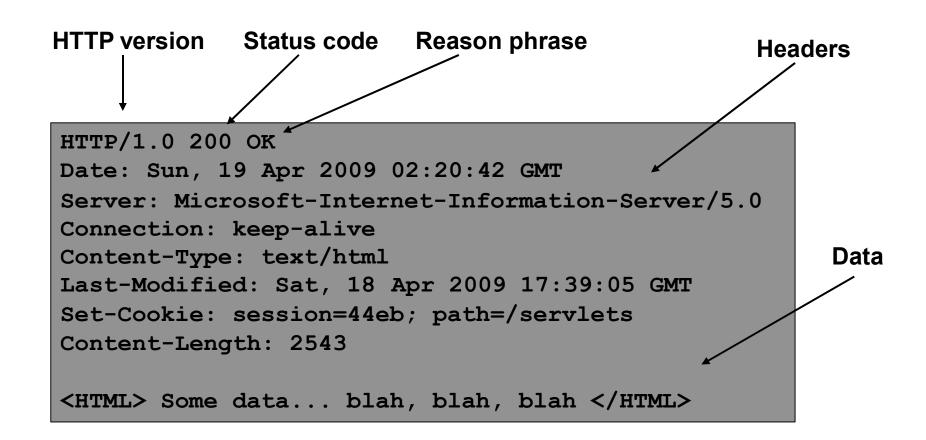

Skype, SMTP (email), HTTP (Web), Halo, BitTorrent

# Web (HTTP) Request

```
Method
        Resource
                   HTTP version
                                                      Headers
GET /index.html HTTP/1.1
Accept: image/gif, image/x-bitmap, image/jpeg, */*
Accept-Language: en
Connection: Keep-Alive
User-Agent: Mozilla/1.22 (compatible; MSIE 2.0; Windows 95)
Host: www.example.com
Referer: http://www.google.com?q=dingbats
                   Blank line
       Data (if POST; none for GET)
```

GET: download data. POST: upload data.

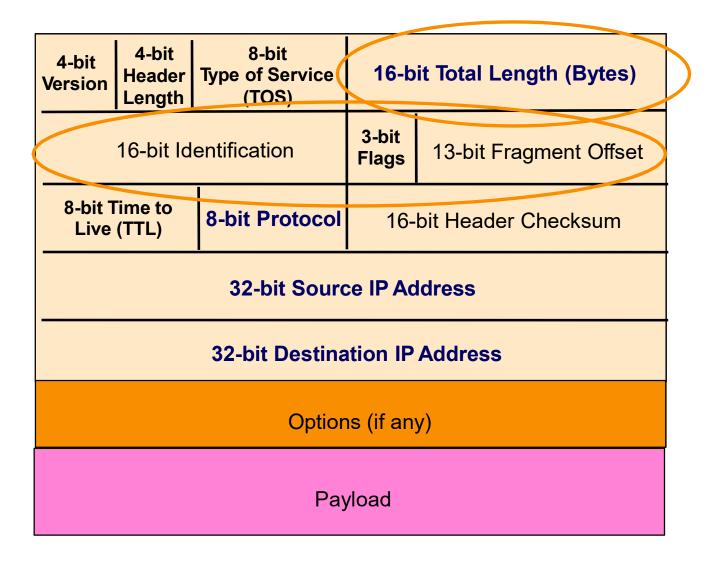

# Web (HTTP) Response

#### Host Names vs. IP addresses

- Host names
  - -Examples: www.cnn.com and bbc.co.uk
  - -Mnemonic name appreciated by humans
  - -Variable length, full alphabet of characters
  - -Provide little (if any) information about location
- IP addresses
  - -Examples: 64.236.16.20 and 212.58.224.131
  - Numerical address appreciated by routers
  - -Fixed length, binary number
  - -Hierarchical, related to host location

#### **IP Packet Structure**

## IP Packet Header Fields (Continued)

- Total length (16 bits)
  - Number of bytes in the packet
  - Maximum size is 65,535 bytes (2<sup>16</sup> -1)
  - -... though underlying links may impose smaller limits
- Fragmentation: when forwarding a packet, an Internet router can split it into multiple pieces ("fragments") if too big for next hop link
- End host reassembles to recover original packet
- Fragmentation information (32 bits)
  - -Packet identifier, flags, and fragment offset
  - Supports dividing a large IP packet into fragments
  - -... in case a link cannot handle a large IP packet

#### **Example: E-Mail Message Using MIME**

```
MIME version
                   From: jrex@cs.princeton.edu
                   To: feamster@cc.gatech.edu
                   Subject: picture of my cat
 method used
                   MIME-Version: 1.0
to encode data
                   Content-Transfer-Encoding: base64
                   Content-Type: image/jpeg
type and subtype
                   Base64 encoded data ....
                   JVBERi0xLjMNJeLjz9MNMSAwI
                   .....base64 encoded data
   encoded data
```

## **Example With Received Header**

Content-Type: text/plain; charset=ISO-8859-1; format=flowed

**Content-Transfer-Encoding: 7bit**

## **IP Packet Structure**

4-bit Version	Lucador I Type of Service 1 16-bit Intal Length (Rytee)						
16-bit Identification			3-bit Flags	13-bit Fragment Offset			
8-bit Time to Live (TTL) 8-bit Protocol		16-bit Header Checksum					
32-bit Source IP Address							
32-bit Destination IP Address							
Options (if any)							
Payload							

#### IP Packet Header Fields

- Version number (4 bits)
  - Indicates the version of the IP protocol
  - Necessary to know what other fields to expect
  - Typically "4" (for IPv4), and sometimes "6" (for IPv6)
- Header length (4 bits)
  - Number of 32-bit words in the header
  - Typically "5" (for a 20-byte IPv4 header)
  - -Can be more when IP options are used
- Type-of-Service (8 bits)
  - Allow packets to be treated differently based on needs
  - -E.g., low delay for audio, high bandwidth for bulk transfer

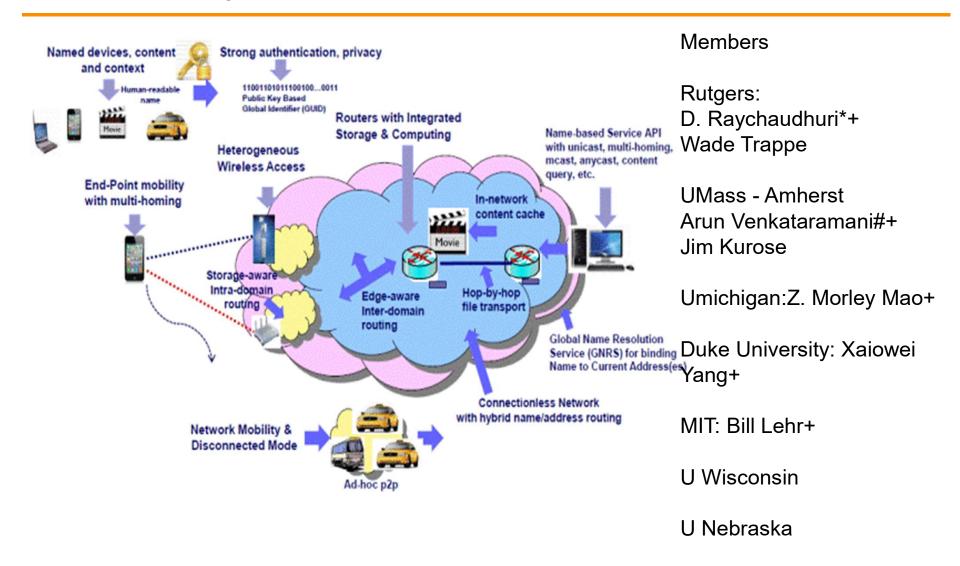

## Sample Email (SMTP) interaction

```
S: 220 hamburger.edu
C: HELO crepes.fr
S: 250 Hello crepes.fr, pleased to meet you
C: MAIL FROM: <alice@crepes.fr>
S: 250 alice@crepes.fr... Sender ok
C: RCPT TO: <bob@hamburger.edu>
S: 250 bob@hamburger.edu ... Recipient ok
C: DATA
S: 354 Enter mail end with "." on a line by itself
C: F
        lamburger-list@burger-king.com Email header
   To:
C:
                              Email body
S: 250 Message accepted for delivery
C: QUIT Lone period marks end of message
S: 221 hamburger.edu closing connection
                                                    63
```

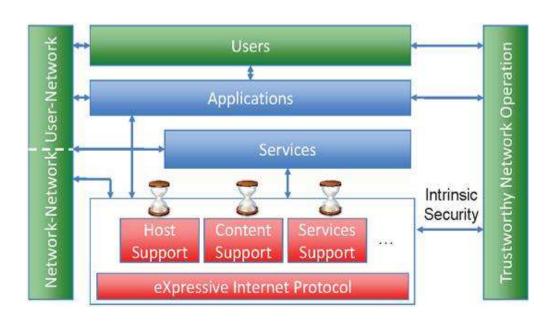

# Future Internet Architecture (FIA) Awards - 2010

- Follow on to FIND Future Internet Design, 50 awards over 5 years
- Inform the development of future trustworthy, robust networks
- \$8M/3 year grant for each of these projects:
- Mobility First
- NEBULA
- eXpressive Internet Architecture (XIA)
- Named Data Networking (NDN)

# **Mobility First**

# eXpressive Internet Architecture (XIA)

Yale University

# The problem

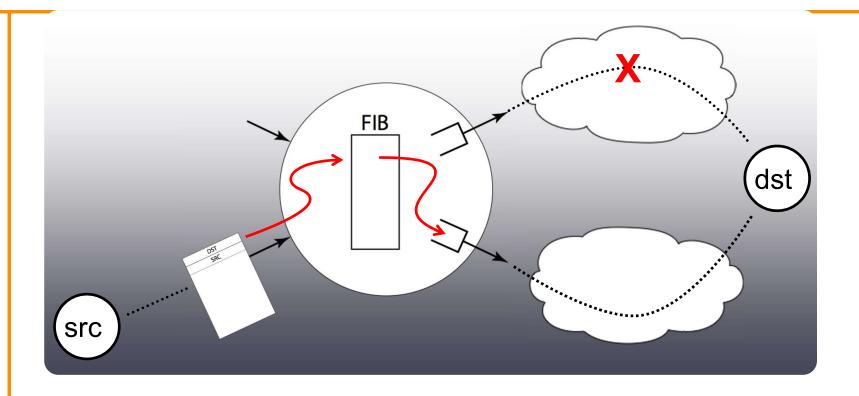

# Communication v. Distribution

Communication Distribution

Naming Endpoints Content

Security Secure Process Secure Content

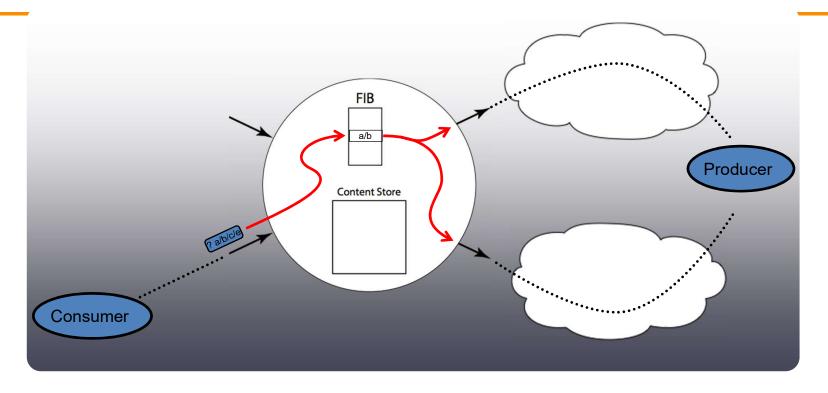

# Today

Path determined by global routing, not local choice

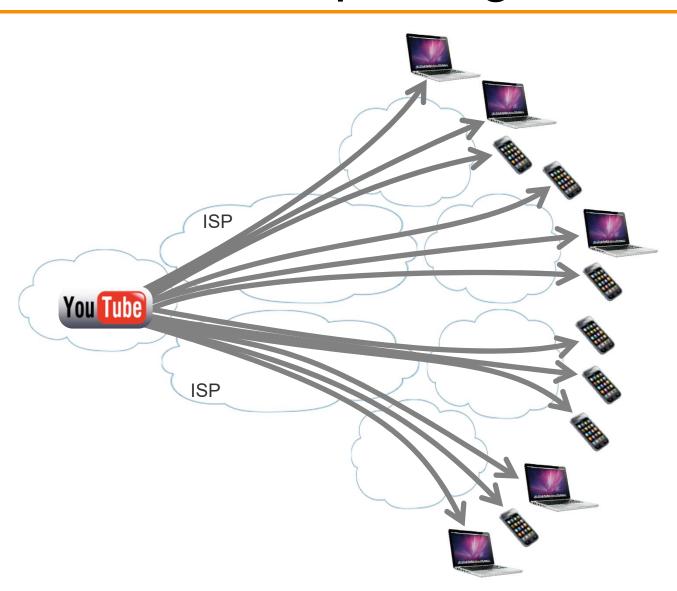

Structural asymmetry precludes market mechanisms and encourages monopoly formation

# NDN approach

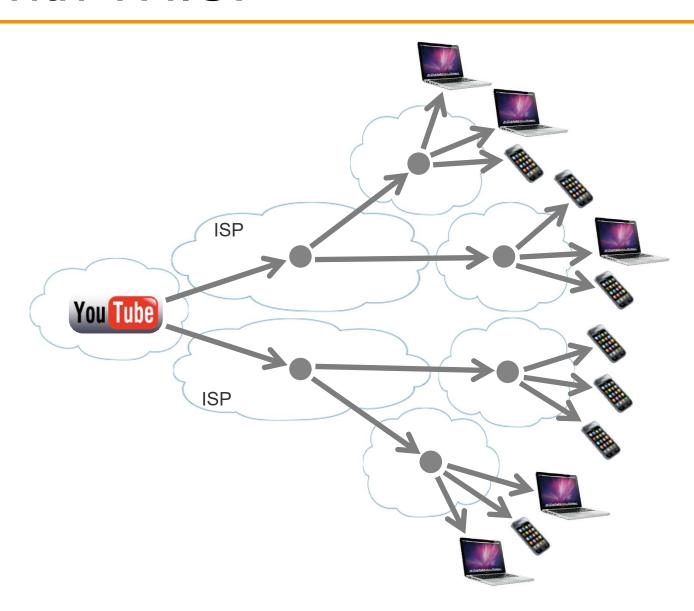

- Packets say 'what' not 'where' (no src or dst)
- Forwarding decision is local
- Upstream performance is measurable

# We envision replacing this:

# With THIS:

# Future Internet Architecture Next Phase (FIA-NP) Awards - 2014

- Built upon success of FIA. Move from design to piloted deployments in real world setting.
- No one architecture will replace Internet wholesale.
- \$15M total to 3 projects:
  - XIA-NP
    - Tests in vehicle network and large scale video delivery
  - NDN-NP established industry consortium
    - Open mHealth and UCLA Facilities Management
  - Mobility First-NP
    - Wireless provider, content delivery network, weather emergency notification system

# **Group Discussions**

• Pls discuss the potential attacks towards different layers (physical/link layers, IP layers, transportation layers).
